

DEA Ghost 200 (underground gate motor)

MANUAL OPERATION

WARNING: BEFORE CARRYING OUT THE RELEASE AND SHUT-DOWN OPERATIONS, MAKE SURE THAT YOU HAVE CUT POWER TO THE OPERATOR.

GHOST 200 RELEASE MECHANISM

All GHOST 200 models have an unlocking system; the working of this system is the following: Once you have unlocked with a special key the spring device contained in the lever unit, the operator is released and, if no other obstructions are present, the gate is free to move without hindrance. The opposite procedure, in other words, positioning the gate on the lever unit and blocking the spring device with the apposite special key, returns the GHOST 200 operator to normal working conditions.
